To give the function-call trace for java Harmonic 3 5, let's break down the execution of the program step by step.

- 1. The program is invoked with the command java Harmonic 3 5.
- 2. The main method receives the arguments 3 and 5 in the args array.
- 3. The main method iterates over the args array, converting each argument to an integer and calling the harmonic method with that integer.

Let's trace the calls in detail:

First iteration (i = 0):

```
• Argument: 3
```

- Conversion: arg = Integer.parseInt(args[0]) = 3
- Method call: value = harmonic(3)

Inside harmonic(3):

- Initialize sum = 0.0
- For loop:

```
i = 1: sum += 1.0 / 1 -> sum = 1.0
```

- i = 2: sum += 1.0 / 2 -> sum = 1.5
- Return: 1.83333333333333333
- Print: StdOut.println(1.83333333333333333333)

Second iteration (i = 1):

```
• Argument: 5
```

- Conversion: arg = Integer.parseInt(args[1]) = 5
- Method call: value = harmonic(5)

Inside harmonic(5):

- Initialize sum = 0.0
- For loop:

```
i = 1: sum += 1.0 / 1 -> sum = 1.0
```

- i = 2: sum += 1.0 / 2 -> sum = 1.5

- Return: 2.2833333333333333
- Print: StdOut.println(2.283333333333333)

Function-Call Trace

- 1. Call main with args = ["3", "5"]
- 2. Call Integer.parseInt("3") -> returns 3
- 3. Call harmonic(3)
 - Initialize sum = 0.0
 - For loop: i = 1 to 3
 - i = 1: sum += 1.0 / 1 -> sum = 1.0
 - i = 2: sum += 1.0 / 2 -> sum = 1.5
 - Return 1.8333333333333333
- 4. Call StdOut.println(1.83333333333333333)
- 5. Call Integer.parseInt("5") -> returns 5
- 6. Call harmonic(5)
 - Initialize sum = 0.0
 - For loop: i = 1 to 5
 - i = 1: sum += 1.0 / 1 -> sum = 1.0
 - i = 2: sum += 1.0 / 2 -> sum = 1.5
 - Return 2.283333333333333
- 7. Call StdOut.println(2.2833333333333333)

So, the output of running java Harmonic 3 5 would be:

- 1.833333333333333
- 2,283333333333333
